

## Advanced Feature PrintPAL Printer Mapping Utility

UniPrint™ PrintPAL is an integrated GUI-based utility that allows network administrators to create rules to automatically assign printers to user sessions based on:

- Active Directory user/group name
- Host names
- Client IP address or IP range

The PrintPAL printer mapping utility ensures that users are always assigned with the correct printers whenever and wherever they are working.

## How It Works

Figure 1 shows the interface of PrintPAL. Network administrators can assign printers based on the different criteria. As users log into their systems, the rules will be processed and the appropriate printers are mapped according to the user profiles. If and when users move to other PCs or IP ranges, different sets of rules will apply and printer mapping will be updated accordingly.

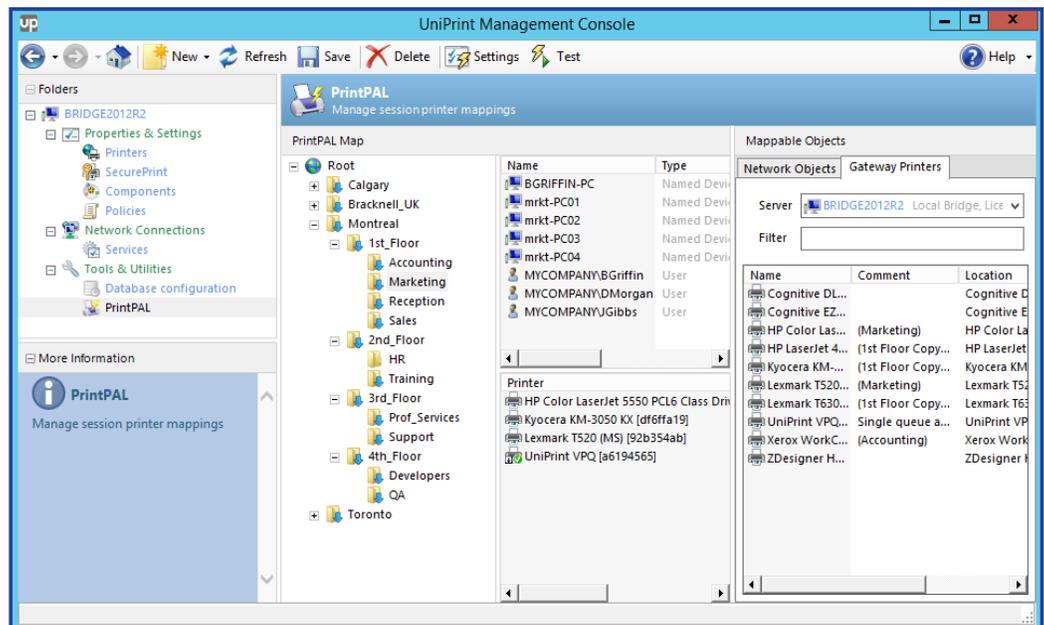

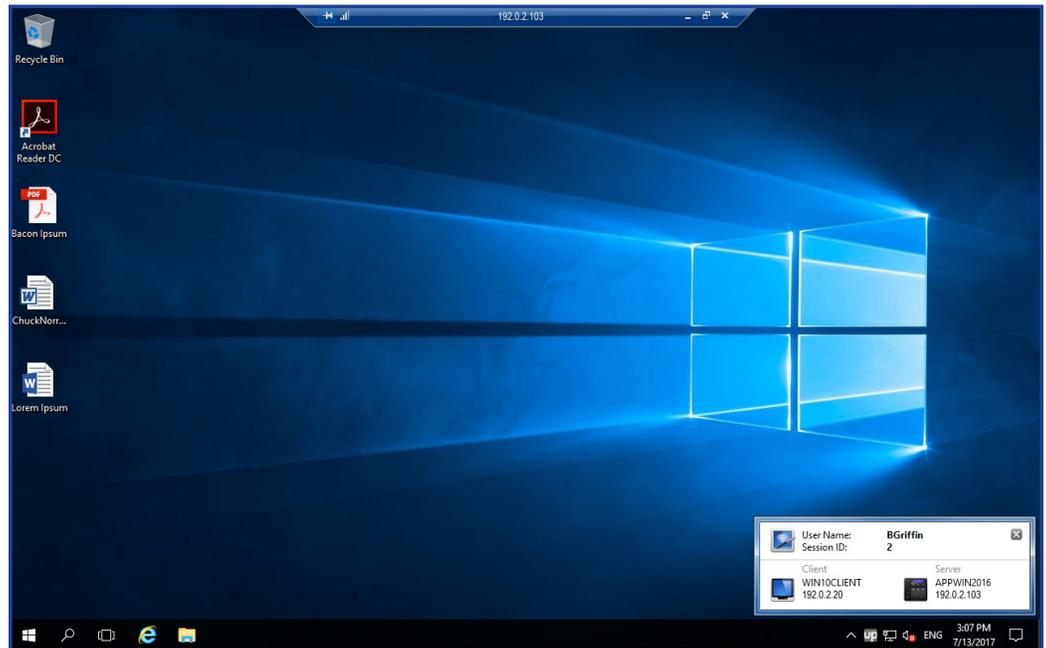

Fig. 2: Screen display of Client IP address

Furthermore, unlike other proximity or location-based printing software for Citrix or Microsoft RDS environments, UniPrint Infinity keeps track of the client IP address. This allows users to print to the printer closest to their physical locations.

## Features

- Assign printers to user sessions based on their location or Active Directory Group or OU
- Fully integrated GUI design
- AD integration
- Session printer assignment re-evaluated on session reconnect
- Manual override for users to choose their own printers

## Benefits

- Reduce help desk calls for routine printer mapping
- Increase employee productivity by ensuring correct printers are assigned for users' locations
- Increase security by reducing the risk of users printing documents to wrong printers
