

UniPrint Vault for Corporate and Public Printing

Expand your printing beyond the office

Print securely through the cloud from any device and release documents at both your corporate network or public print locations!

With continuing innovation in the world of mobile, digital transformation has drastically changed the way employees work in today's corporate world! Employees are constantly on the go and equipped with mobile devices that aid them in completing their work, anytime and anywhere. Employers are moving everything to the secure cloud, and users need to be able to connect to it reliably, anywhere, anytime, seamlessly. To achieve significantly higher levels of productivity, mobile workers need to be able to print without being restricted to their corporate printers!

Vendors have been slow to adapt to the growing need of corporate and public printing integration, preventing employees from printing when away from the office, or even to other printers within their company office. Digital transformation is a means to increase productivity, not decrease it! Printing issues while printing from mobile devices and from remote locations, while away from the office, had led to a significant drop in productivity for employees! However, with the transformational technology now offered by UniPrint Vault, users can put these concerns behind themselves!

Empower employees with secure anywhere, anytime mobile printing!

UniPrint Vault is a mobile app that works in conjunction with UniPrint Infinity, SecurePrint, and ePRINTit™, to provide a universal printing experience for users wanting to release print jobs at their corporate offices, or at ePRINTit™ public print locations.

UniPrint Vault provides mobile users the flexibility to authenticate and release their print jobs through the cloud in several secure, protected ways! Your print orders now securely follow you wherever you go!

Corporate users can print their documents to any ePRINTit™ public print location, allowing mobile workers to print at any time, and to any location! Users are no longer restricted to printing solely from their corporate setting. Organizations benefit from no longer having to deal with print driver mapping and

misplaced print orders being obtained by unauthorized employees, providing an additional layer of print security when printing on the go!

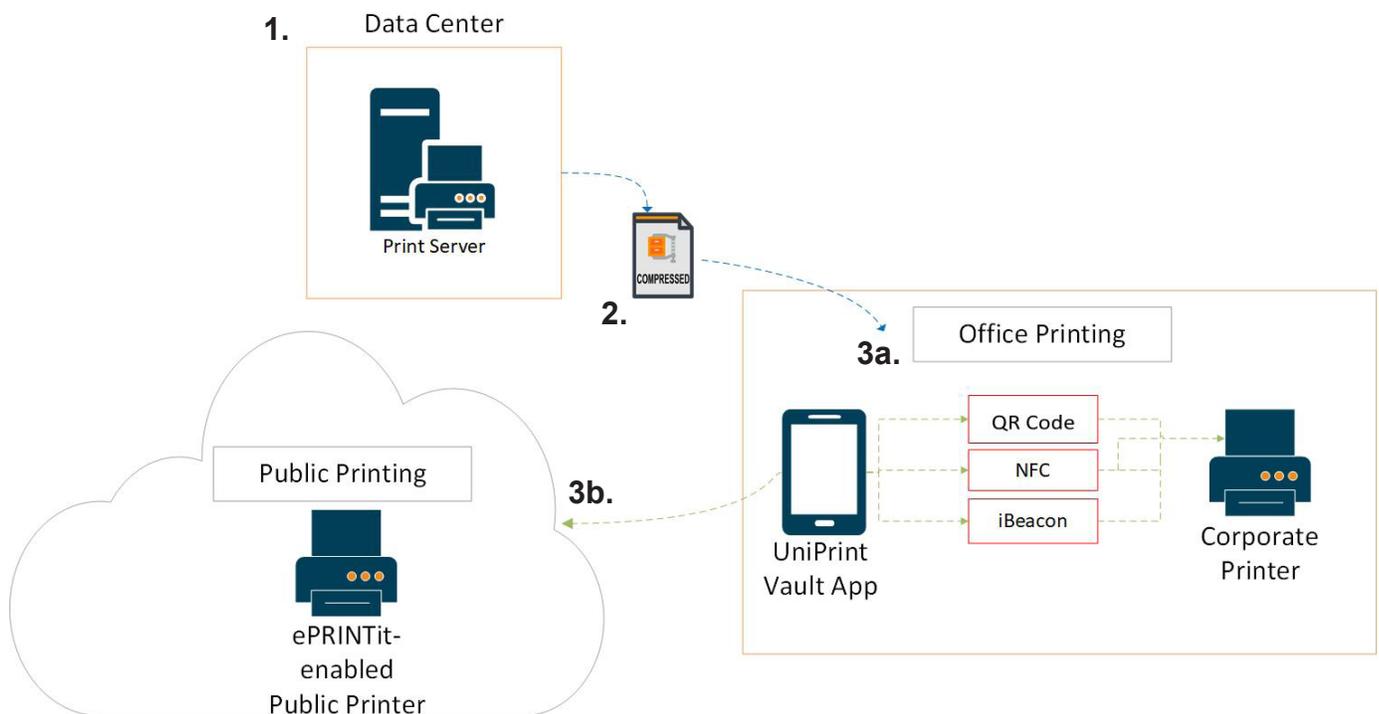

Experience a streamlined, universal print environment

As UniPrint Vault requires users to enter their SecurePrint password only when in front of the print station, documents containing sensitive information are released and obtained with minimal delay, significantly reducing the risk of a hardcopy theft or misplacement!

Trying to maintain consistency and keeping your print environment secure can be a huge challenge. By adopting UniPrint Vault, give your employees the ease of managing their print jobs from a single platform, whether it be documents they'd like to print at a public print location while on the go, or print jobs they'd like to print directly from corporate printers.

Experience a similar print experience across desktop and mobile devices. Enjoy the simplicity of a single, cloud based secure print solution and better control your printing experience.

How it Works

1. Once users hit print from their respective sessions, the UniPrint Print Server receives and converts the print job to a secure, compressed PDF file that is fully encrypted with end-to-end 256-bit encryption.

2. The compressed, print-ready PDF file will be held in the Virtual Print Queue (VPQ) until released at a printer.

3a. UniPrint Vault users can then release print jobs at enterprise printers via QR code, NFC, or iBeacon technology.

3b. Additionally, Vault users can also release print jobs at participating ePRINTit™ Public Print Locations.

Implement a versatile, secure cloud print solution for your workforce

The flexible nature of UniPrint Vault technology enables it to function with all printer manufacturers and models, eliminating the need to standardize enterprise printer fleets. No longer is there a need to worry about device to printer compatibility or connectivity. Additionally, secure mobile release options empower end users with the control to prevent security breaches.

With four convenient, secure options to release print jobs, all accessible from within one app, users enjoy a simple, user-friendly print experience!

1. **NFC:** Allows users to tap their device over the printer they want to print to, enabling release.
2. **iBeacon:** Allows users to scan for beacons in their proximity and select the printer they want to release their documents to.
3. **QR Code:** Allows users to capture a quick response code attached to a printer to release print jobs to it.
4. **ePRINTit™ Public Printing:** Allows corporate users to print to public print locations through ePRINTit's secure cloud when away from the office.

The UniPrint Vault application presents users with four options to securely release compressed print jobs from the print server to a printer and obtain their hardcopy. For employees working from the office, they can print directly to any corporate printer by scanning a QR Code, tapping via NFC technology, or iBeacon release. For workers on the go, they can securely print their documents by selecting the ePRINTit™ public printing locations option, enabling them to select the closest printer of their choice, and then have their print jobs sent to that specific printer. Upon selecting the public printing option, users will be provided an 8-digit secure release code, which they will be required to enter at the public print station before being able to retrieve their documents.

ePRINTit™ Public Print Locations

With ePRINTit™'s geo-location feature integrated with the UniPrint Vault app, users can now simply hit the ePRINTit™ public print option for print release, and all nearby public print locations will be shown immediately! A secure 8-digit release code is provided to users, who are then able to retrieve their print order only when they arrive and enter their code at the print release station. All print data is securely stored and encrypted, and automatically destroyed after a certain period of time, ensuring ultra-secure print data protection.
